

Product Overview

The NCA1051C is a high-speed CAN transceiver that provides an interface between a Controller Area Network (CAN) protocol controller and the physical two-wire CAN bus. The NCA1051C implements the CAN physical layer as defined in ISO 11898-2:2024 and SAE J2284-1 to SAE J2284-5. This implementation enables reliable communication in the CAN FD fast phase at data rates up to 5 Mbit/s. The NCA1051C provides thermal protection and transmit data dominant time out function.

Key Features

- Fully compatible with the ISO11898-2 standard
- Ideal passive behavior to the CAN bus when the supply voltage is off
- I/O voltage range supports 1.8V, 3.3V and 5V MCU
- Power supply voltage
- V_{IO} : 1.7V to 5.5V
- V_{CC} : 4.5V to 5.5V
- Bus fault protection of -70V to +70V
- Short circuit protection
- Bus common-mode voltage of -12V to +12V
- Transmit data (TXD) dominant time out function
- Over temperature protection
- Improve the bus signal by ringing reduction
- Data rate: up to 5Mbps
- Low loop delay: <250ns
- Operation temperature: -40°C to +125°C
- RoHS & REACH compliant

Applications

- CAN bus standards such as CANopen, DeviceNet, NMEA2000, ARNIC825, ISO11783 and CANaerospace
- Highly loaded CAN networks down to 10 kbps networks
- Industrial automation, control, sensors, and drive systems
- Building, security, and climate control automation

1. Pin Configuration and Functions

Figure 1-1 NCA1051C, NCA1051CN Package

Table 1-1 NCA1051C Pin Configuration and Description

NCA1051C PIN NO.	NCA1051CN PIN NO.	SYMBOL	FUNCTION
1	1	TXD	CAN transmit data input (LOW for dominant and HIGH for recessive bus states)
2	2	GND	Ground
3	3	VCC	Power Supply
4	4	RXD	CAN receive data output (LOW for dominant and HIGH for recessive bus states)
5	\	VIO	Logic I/O supply voltage
\	5	NC	No connection
6	6	CANL	Low-level CAN bus line
7	7	CANH	High-level CAN bus line
8	8	S	S (silent mode) select pin (active high)

2. Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)^{[1][2]}.

Parameters	Symbol	Min	Max	Unit
Power Supply Voltage	VCC, VIO	-0.3	7	V
Logic I/O Voltage	TXD, RXD, S	-0.3	7	V
Maximum bus Pin Voltage	V _{CANH} , V _{CANL}	-70	70	V
Voltage between pin CANH and pin CANL	V _{CANH} - V _{CANL}	-70	70	V
Junction temperature	T _J	-40	150	°C
Storage Temperature	T _{stg}	-65	150	°C

^[1] Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to Absolute Maximum Rating condition for extended periods may affect device reliability.

^[2] All voltage values, except for "Voltage between pin CANH and pin CANL", are with respect to GND terminal.

3. EMC Ratings

Parameters	Ratings	Value	Unit	
Electrostatic discharge	Human Body Model (HBM), per ANSI/ ESDA/ JEDEC JS-001	±8	kV	Not H Version

7. Function Description

7.1. Overview

The NCA1051C is a CAN transceiver which fully compatible with the ISO11898-2 standard. The data rate of the NCA1051C is up to 5Mbps, and it can support up to 110 CAN nodes. Meanwhile, the maximum transmission rate of the CAN bus is limited by the bus load, the quantity of nodes, the cable length, and other factors. The NCA1051C has a $\pm 12V$ input common-mode range, enabling reliable communication between bus nodes with large ground potential deviations.

Comprehensive protection features are designed to enhance the device and network robustness in harsh operating conditions. The transmit data dominant time-out function prevents the bus from lock-up by the faults on micro-controller. Moreover, the NCA1051C provides thermal protection and short-circuit protection.

7.2. Functional Block Diagram

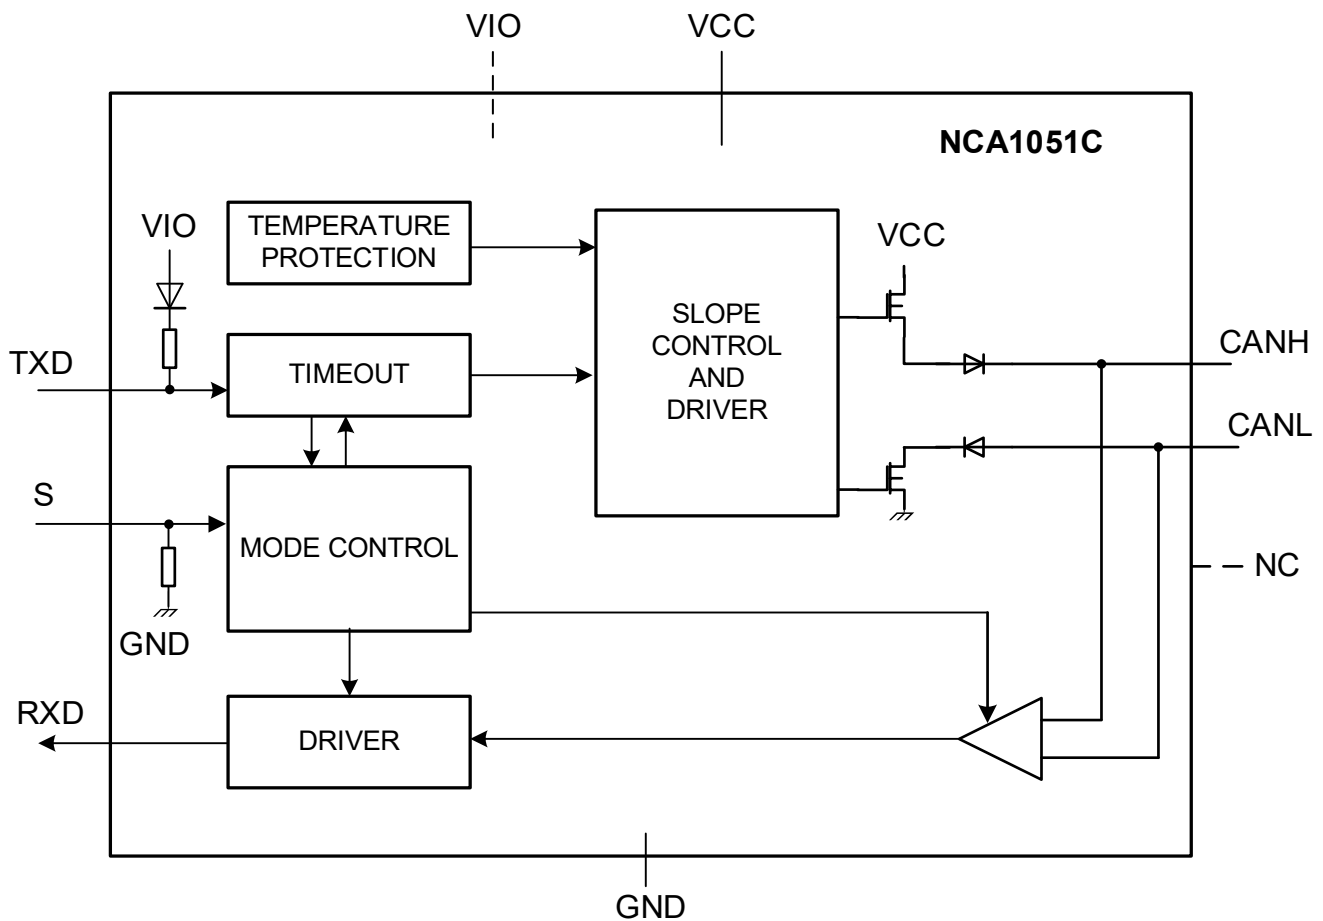

Figure 7-1 Block diagram of NCA1051C

7.3. Signal Ringing Reduction

The signal ringing arises from the reflection caused by the impedance mismatch in complex star topologies of CAN network for the sake of the nodes that act as stubs. On a dominant-to-recessive edge, the driver output impedance goes to about 80 kΩ and signal reflected back experiences impedance mismatch, which causes ringing.

NCA1051C resolves this issue by TX-based signal ringing reduction. Following a dominant-to-recessive edge, transmitter output impedance keeps low (about 100 Ω) at first and therefore matches the network characteristic impedance. After the reflections fade away, driver output impedance goes to high-Z and recessive bit is clean at sampling point.

7.4. VIO Supply Pin

Two versions of the NCA1051C are available, only differing in the function of a single pin. Pin 5 is either a VIO supply pin or a NC pin.

Pin VIO should be connected to the microcontroller supply voltage (see Figure 8-1). This will adjust the signal levels of pins TXD, RXD and S to the I/O levels of the microcontroller.

For versions of the NCA1051CN without a VIO pin, the VIO input is internally connected to VCC. This sets the signal levels of pins TXD, RXD and S to levels compatible with 5 V microcontrollers.

7.5. Device Operating Modes

The device has two main operating modes: Normal mode and Silent mode. Operating mode is selected via the S input pin. Table 7-1 shows a description of the operating modes under normal supply conditions.

Table 7-1 Operating Modes

Mode	S pin	TXD pin	CAN driver	RXD pin
Normal	LOW	LOW	dominant	LOW
		HIGH	recessive	LOW when bus dominant HIGH when bus recessive
Silent	HIGH	X	recessive	LOW when bus dominant HIGH when bus recessive

7.5.1. Normal Mode

A LOW level on pin S selects Normal mode. In this mode, the transceiver can transmit and receive data via the bus lines CANH and CANL (see Figure 7-1). The differential receiver converts the analog data on the bus lines into digital data which is output to pin RXD. The slopes of the output signals on the bus lines are controlled internally and are optimized in a way that guarantees the lowest possible Electromagnetic Emission (EME).

After entering normal mode, it is recommended to firstly pull up TXD pin to a high level for at least 200ns before communications, for fear of unwanted TXD timeout caused by unstable TXD level during the power-on phase.

7.5.2. Silent Mode

A HIGH level on pin S selects Silent mode. In Silent mode, the transmitter is disabled, releasing the bus pins to recessive state. All other IC functions, including the receiver, continue to operate as in Normal mode. Silent mode can be used to prevent a faulty CAN

controller from disrupting all network communications.

7.6. Fail-safe features

7.6.1. TXD Dominant Time-Out Function (TXD DTO)

A 'TXD dominant time-out' timer circuit prevents the bus lines from being driven to a permanent dominant state (blocking all network communication) if pin TXD is forced permanently LOW by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TXD.

If the duration of the LOW level on pin TXD exceeds the internal timer value $t_{to(dom)TXD}$, the transmitter is disabled, driving the bus lines into a recessive state. The timer is reset by a positive edge on pin TXD. The TXD dominant time-out time also defines the minimum possible bit rate of 10 kbit/s.

7.6.2. Internal Biasing of TXD and S Input Pins

Pin TXD has an internal pull-up to VIO to ensure a safe, defined state, in case the pin is left floating. Pin S, an internal pull-down to GND. Pull-up current in TXD and pull-down current in S flow in these pins in all states.

7.6.3. Undervoltage Detection on Pins VCC and VIO

The supply terminals have undervoltage detection that places the device in protected mode. This protects the bus during an undervoltage event on either the VCC or VIO supply terminals.

When VCC or VIO drop below their respective undervoltage detection levels, $V_{uvd(VCC)}$ and $V_{uvd(VIO)}$, the transceiver will switch off and disengage from the bus (zero load) until VCC and VIO have recovered.

Table 7-2 Undervoltage Lockout 5V Only Devices (NCA1051CN)

VCC	Device State	Bus Output	RXD
$>UV_{VCC}$	Normal	Per TXD	Mirrors Bus ^[1]
$<UV_{VCC}$	Off	High Impedance	High Impedance

^[1] Mirrors bus state: low if CAN bus is dominant, high if CAN bus is recessive.

Table 7-3 Undervoltage Lockout I/O Level Shifting Devices (NCA1051C)

VCC	VIO	Device State	Bus Output	RXD
$>UV_{VCC}$	$>UV_{VIO}$	Normal	Per TXD	Mirrors Bus ^[1]
$<UV_{VCC}$	$>UV_{VIO}$	Off	High Impedance	High Impedance
$>UV_{VCC}$	$<UV_{VIO}$	Off	High Impedance	High Impedance
$<UV_{VCC}$	$<UV_{VIO}$	Off	High Impedance	High Impedance

^[1] Mirrors bus state: low if CAN bus is dominant, high if CAN bus is recessive.

7.6.4. Unpowered Device

The device is designed to be 'ideal passive' or 'no load' to the CAN bus if it is unpowered. The bus terminals (CANH, CANL) have extremely low leakage currents when the device is unpowered to avoid loading down the bus. This is critical if some nodes of the network are unpowered while the rest of the of network remains in operation. The logic terminals also have extremely low leakage currents when the device is unpowered to avoid loading down other circuits that may remain powered.

7.6.5. Over-Temperature Protection (OTP)

The output drivers are protected against over-temperature conditions. If the virtual junction temperature exceeds the shutdown junction temperature T_{SD} , the output drivers will be disabled until the virtual junction temperature becomes lower than T_{SD} and TXD becomes recessive again. By including the TXD condition, the occurrence of output driver oscillation due to temperature drifts is avoided.

7.6.6. Short Circuit Protection

The current limiting circuit of the CANH and CANL can protect the transceiver from damage when they are short to GND or a supply voltage during communication. If the device heats up to over temperature threshold due to a continuous short on the CANH or CANL, the internal overtemperature protection switches off the bus transmitter.

8. Application Note

8.1. Typical Application

The NCA1051C requires a 0.1 μF bypass capacitors between VCC and GND. The capacitor should be placed as close as possible to the package. The Figure 8-1 and Figure 8-2 are the typical applications of NCA1051C.

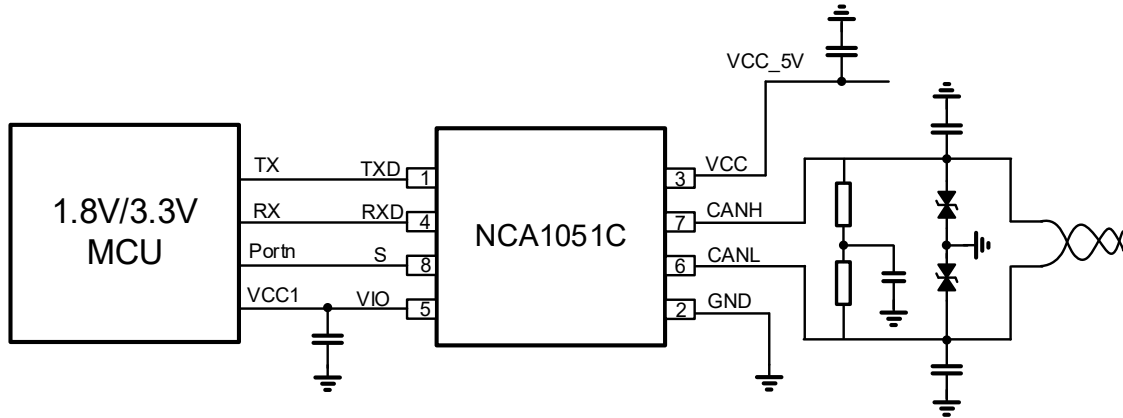

Figure 8-1 Typical CAN Bus Application Using 1.8V/3.3V CAN Controller

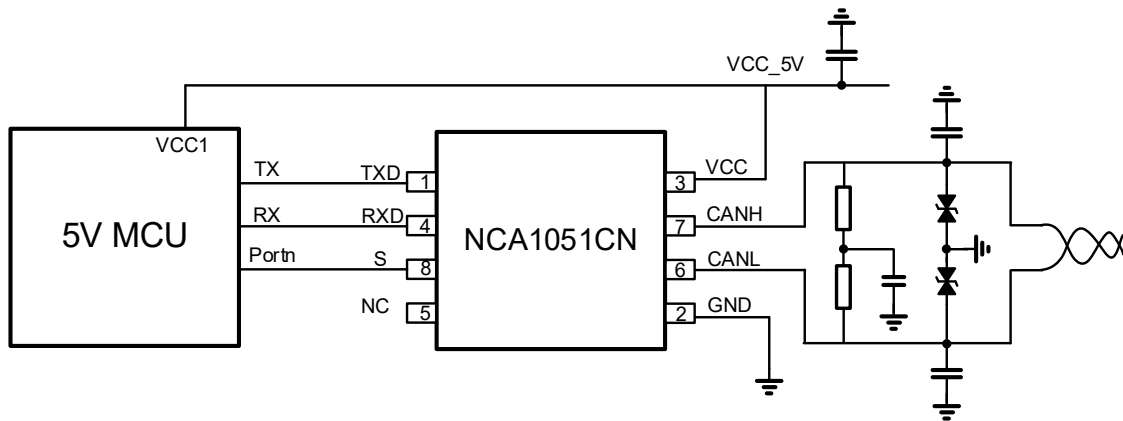

Figure 8-2 Typical CAN Bus Application Using 5V CAN Controller

13. Revision History

Revision	Description	Date
1.0	Initial Version.	2024/9/30
1.1	Add the description of short circuit protection, Add system-level ESD parameters and modified SOP8 carrier information	2024/12/24
1.2	Correct common mode voltage information error; Add H version device and update ESD parameters; Update Loop Time Voltage Waveforms in Figure 6-4	2026/03/24
