

Product Overview

The NSI824x devices are high reliability quad-channel digital isolators. The NSI824x device is safety certified by UL1577 support several insulations withstand voltages (3kVrms, 3.75kVrms, 5kVrms, 8kVrms), while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of the NSI824x is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 250kV/us. The NSI824x device provides digital channel direction configuration and the default output level configuration when the input power is lost. Wide supply voltage of the NSI824x device supports to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use.

Key Features

- Up to 8000V_{rms} Insulation voltage
- Data rate: DC to 150Mbps
- Power supply voltage: 2.5V to 5.5V
- High CMTI: 250kV/us
- Chip level ESD: HBM: ±8kV
- Robust Electromagnetic Compatibility (EMC)
 - System-Level ESD, EFT, and Surge Immunity
 - Low Emissions
- Default output high level or low-level option
- Low power consumption: 1.5mA/ch (1 Mbps)
- Low propagation delay: <15ns
- Operation temperature: -55°C~125°C
- RoHS-compliant packages:
 - SOP16(150mil)
 - SSOP16
 - SOP16(300mil)
 - SOP16(600mil)

Safety Regulatory Approvals

- UL recognition: up to 8000V_{rms} for 1 minute per UL1577
- CQC certification per GB4943.1
- CSA component notice 5A
- DIN EN IEC 60747-17 (VDE 0884-17)

Applications

- Industrial automation system
- Isolated SPI, RS232, RS485
- General-purpose multichannel isolation
- Motor control

7. Function Description

7.1. Overview

The NSI824x is a Quad-channel digital isolator based on a capacitive isolation barrier technique. The digital signal is modulated with RF carrier generated by the internal oscillator at the Transmitter side. Then it is transferred through the capacitive isolation barrier and demodulated at the Receiver side.

The NSI824x devices are high reliability quad-channel digital isolator. The NSI824x device is safety certified by UL1577 support 8kV_{rms} insulation withstand voltages, while providing high electromagnetic immunity and low emissions at low power consumption. The data rate of the NSI824x is up to 150Mbps, and the common-mode transient immunity (CMTI) is up to 200kV/us. The NSI824x device provides digital channel direction configuration and the default output level configuration when the input power is lost. Wide supply voltage of the NSI824x device support to connect with most digital interface directly, easy to do the level shift. High system level EMC performance enhance reliability and stability of use.

The NSI824x has a default output status when VDDIN is unready and VDDOUT is ready as shown in Table 7.1, which helps for diagnosis when power is missing at the transmitter side. The output B follows the same status with the input A after powering up.

Table 7.1 Output status vs. power status

<i>Input¹</i>	<i>EN_x²</i>	<i>VDDIN status</i>	<i>VDDOUT status</i>	<i>Output</i>	<i>Comment</i>
H	H or NC	Ready	Ready	H	Normal operation.
L	H or NC	Ready	Ready	L	
X	L	Ready	Ready	Z	Output Disabled, the output is high impedance
X	H or NC	Unready	Ready	L(NSI824xx0) H(NSI824xx1)	The output follows the same status with the input after input side VDD is powered on.
X	L	Unready	Ready	Z	Output Disabled, the output is high impedance
X	X	Ready	Unready	Undetermined	The output follows the same status with the input after output side VDD is powered on.

Note: H=Logic high; L=Logic low; X=Logic low or logic high
VDDIN is input side power; VDDOUT is output side power.

(1) There is a protection diode between the input and the VDDIN. When the VDDIN is floating, the strong drive signal through the input pin will put the VDDIN in an indeterminate state.

(2) The EN_x is output side enable.

7.2. OOK Modulation

NSI824x is based on a capacitive isolation barrier technique and the digital signal is modulated with RF carrier generated by the internal oscillator at the transmitter side, as shown in Figure 7.1 to Figure 7.2, then it is transferred through the capacitive isolation barrier and demodulated at the receiver side. The modulation uses OOK modulation technique with key benefits of high noise immunity and low radiation EMI.

8. Application Note

8.1. Typical Application Circuit

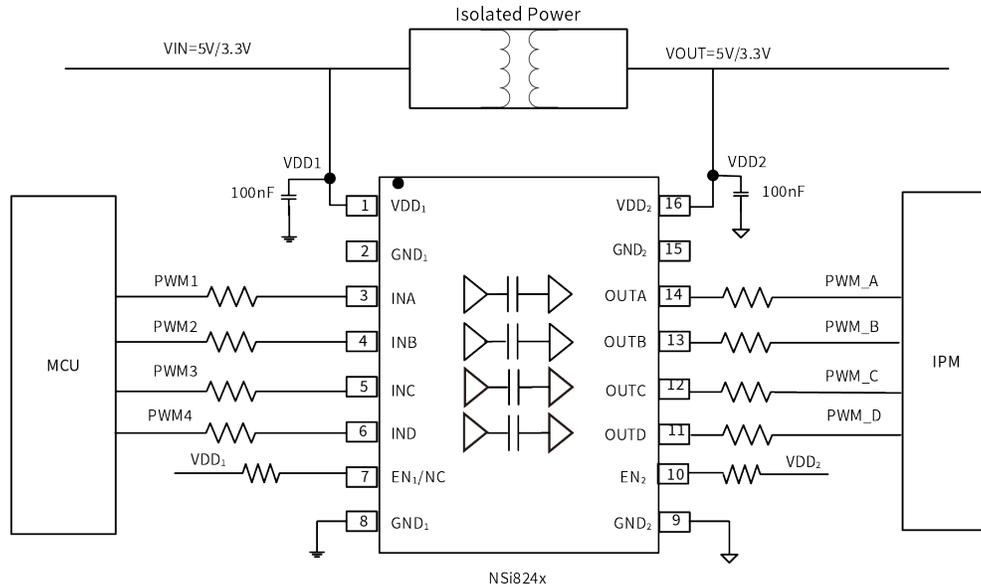

Figure 8.1 Typical PWM isolation circuit for IPM

8.2. PCB Layout

The NSI824x requires a 0.1 μF bypass capacitor between VDD1 and GND1, VDD2 and GND2. The capacitor should be placed as close as possible to the package. Figure 8.2 to Figure 8.3 show the recommended PCB layout, make sure the space under the chip should keep free from planes, traces, pads and via. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy. The series resistors also improve the system reliability such as latch-up immunity.

The typical output impedance of an isolator driver channel is approximately 50 Ω , $\pm 40\%$. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled impedance PCB traces.

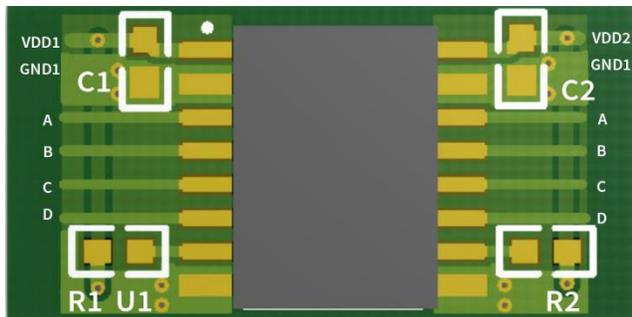

Figure 8.2 Recommended PCB Layout — Top Layer

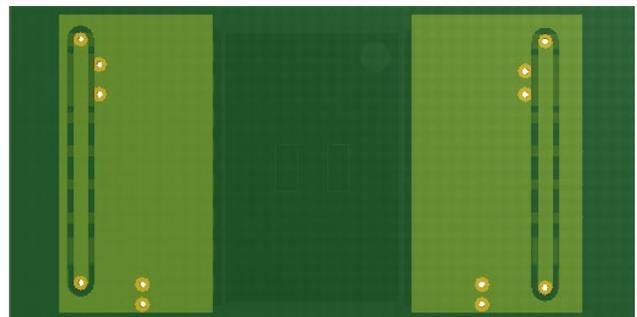

Figure 8.3 Recommended PCB Layout — Bottom Layer

8.3. High Speed Performance

Figure 8.4 shows the eye diagram of NSI824x at 50Mbps data rate output. The result shows a typical measurement on NSI824x with low jitter and wide open eye characteristics.

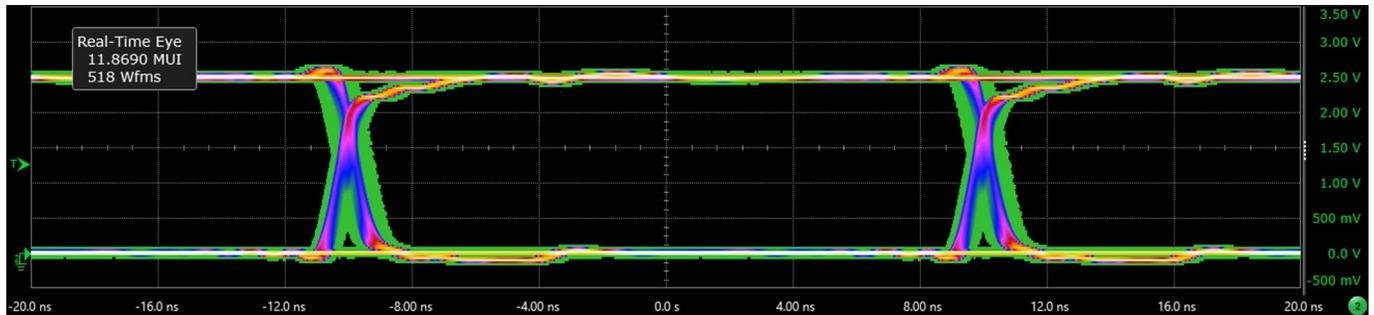

Figure 8.4 Eye Diagram at 50Mbps PRBS 2¹⁶-1, 2.5V and 25°C

8.4. Typical Supply Current Equations

The typical supply current of NSI824x can be calculated using below equations. I_{DD1} and I_{DD2} are typical supply currents measured in mA, f is data rate measured in Mbps, C_L is the capacitive load measured in pF.

NSI8240:

$$I_{DD1} = 0.19 * a1 + 1.45 * b1 + 0.82 * c1.$$

$$I_{DD2} = 1.36 + VDD2 * f * C_L * c1 * 10^{-9}$$

When $a1$ is the channel number of default state input at side 1, $b1$ is the channel number of non-default state input at side 1, $c1$ is the channel number of switch signal input at side 1.

NSI8241:

$$I_{DD1} = 0.87 + 1.26 * b1 + 0.63 * c1 + VDD1 * f * C_L * c2 * 10^{-9}$$

$$I_{DD2} = 0.87 + 1.26 * b2 + 0.63 * c2 + VDD2 * f * C_L * c1 * 10^{-9}$$

When $b1$ is the channel number of non-default state input at side 1, $c1$ is the channel number of switch signal input at side 1, $b2$ is the channel number of non-default state input at side 2, $c2$ is the channel number of switch signal input at side 2.

NSI8242:

$$I_{DD1} = 0.87 + 1.26 * b1 + 0.63 * c1 + VDD1 * f * C_L * c2 * 10^{-9}$$

$$I_{DD2} = 0.87 + 1.26 * b2 + 0.63 * c2 + VDD2 * f * C_L * c1 * 10^{-9}$$

When $b1$ is the channel number of non-default state input at side 1, $c1$ is the channel number of switch signal input at side 1, $b2$ is the channel number of non-default state input at side 2, $c2$ is the channel number of switch signal input at side 2.

13. Revision History

Revision	Description	Date
1.0	Initial version	2020/11/13
1.1	Changed tape and reel information	2020/12/20
1.2	Operating temperature support -55 to 125 °C	2021/7/7
1.3	Update Package Board Layout Example, update CQC information, Add SSOP16 package products	2021/12/29
1.4	Add SOP16 package products. Update SSOP16 Package Shape and Dimension in millimeters. Changed AEC-Q100 description. Update Part Number Rule, Package Board Layout Example. Update SOWW16 VISO. Update Regular Information NSI824xS-DSSR UL1577 file. Correct SOWW16 MSL.	2022/9/7
1.5	Update Typical Supply Current Equations	2023/2/7
1.6	Correct formatting and images. Update Input characteristics. Update Safety certification info throughout the document. Update eye diagram. Update Package Information. Update Function Description.	2025/1/13
